What does a neuron compute?

1 / 1 point

- A neuron computes an activation function followed by a linear function (z = Wx + b)
- A neuron computes a linear function (z = Wx + b) followed by an activation function
- A neuron computes a function g that scales the input x linearly (Wx + b)
- A neuron computes the mean of all features before applying the output to an activation function

/ Correct

Correct, we generally say that the output of a neuron is a = g(Wx + b) where g is the activation function (sigmoid, tanh, ReLU, ...).

Which of these is the "Logistic Loss"?

1 / 1 point

$$\bigcirc \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = max(0, y^{(i)} - \hat{y}^{(i)})$$

$$\bigcap \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = |y^{(i)} - \hat{y}^{(i)}|^2$$

$$\bigcirc \ \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = \mid y^{(i)} - \hat{y}^{(i)} \mid$$

Correct

Correct, this is the logistic loss you've seen in lecture!

Suppose img is a (32,32,3) array, representing a 32x32 image with 3 color channels red, green and 1/1 point blue. How do you reshape this into a column vector?

```
    x = img.reshape((32*32*3,1))
    x = img.reshape((1,32*32,*3))
    x = img.reshape((3,32*32))
    x = img.reshape((32*32,3))

Correct
```

4. Consider the two following random arrays "a" and "b":

1 / 1 point

```
1 a = np.random.randn(2, 3) # a.shape = (2, 3)
2 b = np.random.randn(2, 1) # b.shape = (2, 1)
3 c = a + b
```

What will be the shape of "c"?

- c.shape = (2, 3)
- The computation cannot happen because the sizes don't match. It's going to be "Error"!
- \bigcirc c.shape = (3, 2)
- \bigcirc c.shape = (2, 1)

✓ Correct

Yes! This is broadcasting. b (column vector) is copied 3 times so that it can be summed to each column of a.

5. Consider the two following random arrays "a" and "b":

1 / 1 point

```
1 a = np.random.randn(4, 3) # a.shape = (4, 3)
2 b = np.random.randn(3, 2) # b.shape = (3, 2)
3 c = a*b
```

What will be the shape of "c"?

```
\bigcirc c.shape = (4,2)
```

C chane = (4 3)

The computation cannot happen because the sizes don't match. It's going to be "Error"!c.shape = (3, 3)	
C.S. Tupe = (5, 5)	
Correct Indeed! In numpy the "*" operator indicates element-wise multiplication. It is different from "np.dot()". If you would try "c = np.dot(a,b)" you would get c.shape = (4, 2).	
Suppose you have n_x input features per example. Recall that $X=[x^{(1)}x^{(2)}x^{(m)}].$ What is the dimension of X?	/1 point
\bigcirc $(1,m)$	
$\bigcap (m,1)$	
$\bigcap (m, n_x)$	
\bigcirc (n_x, m)	
✓ Correct	
Recall that "np.dot(a,b)" performs a matrix multiplication on a and b, whereas "a*b" performs an element-wise multiplication.	/1 point
	/1 point
element-wise multiplication.	/1 point
element-wise multiplication. Consider the two following random arrays "a" and "b": 1 a = np.random.randn(12288, 150) # a.shape = (12288, 150) 2 b = np.random.randn(150, 45) # b.shape = (150, 45)	/1 point
element-wise multiplication. Consider the two following random arrays "a" and "b": 1 a = np.random.randn(12288, 150) # a.shape = (12288, 150) 2 b = np.random.randn(150, 45) # b.shape = (150, 45) 3 c = np.dot(a,b)	/ 1 point
element-wise multiplication. Consider the two following random arrays "a" and "b": 1 a = np.random.randn(12288, 150) # a.shape = (12288, 150) 2 b = np.random.randn(150, 45) # b.shape = (150, 45) 3 c = np.dot(a,b) What is the shape of c?	/1 point
element-wise multiplication. Consider the two following random arrays "a" and "b": 1 a = np.random.randn(12288, 150) # a.shape = (12288, 150) 2 b = np.random.randn(150, 45) # b.shape = (150, 45) 3 c = np.dot(a,b) What is the shape of c? © c.shape = (12288, 45)	/ 1 point
element-wise multiplication. Consider the two following random arrays "a" and "b": 1	/1 point
element-wise multiplication. Consider the two following random arrays "a" and "b": 1 a = np.random.randn(12288, 150) # a.shape = (12288, 150) 2 b = np.random.randn(150, 45) # b.shape = (150, 45) 3 c = np.dot(a,b) What is the shape of c? C.shape = (12288, 45) C.shape = (12288, 150) The computation cannot happen because the sizes don't match. It's going to be "Error"!	/ 1 point

"number of columns of a = 150 = number of rows of b"

6.

7.

How do you vectorize this?

- \bigcirc c = a + b.T
- \bigcirc c=a+b
- \bigcirc c = a.T + b
- \bigcirc c = a.T + b.T

9. Consider the following code:

1 / 1 point

```
1 a = np.random.randn(3, 3)
2 b = np.random.randn(3, 1)
3 c = a*b
```

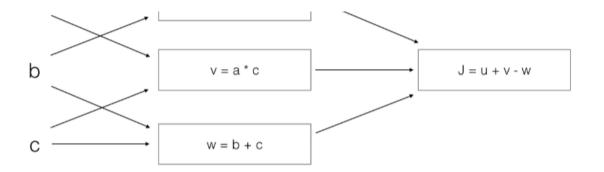

What will be c? (If you're not sure, feel free to run this in python to find out).

- This will invoke broadcasting, so b is copied three times to become (3,3), and * is an element-wise product so c.shape will be (3,3)
- This will invoke broadcasting, so b is copied three times to become (3, 3), and * invokes a matrix multiplication operation of two 3x3 matrices so c.shape will be (3, 3)
- This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector. That is, c.shape = (3,1).
- It will lead to an error since you cannot use "*" to operate on these two matrices. You need to instead use np.dot(a,b)

10. Consider the following computation graph.

1 / 1 point

What is the output J?

$$\int J = (c - 1)*(b + a)$$

$$\int J = a*b + b*c + a*c$$

$$\int J = (b - 1) * (c + a)$$

Yes.
$$J = u + v - w = a*b + a*c - (b + c) = a*(b + c) - (b + c) = (a - 1)*(b + c)$$
.
